

MCP Summer Workshop

Beginner's C++ Tutorial

Follow along with us!

Table of contents

01

What's programming all about?

Introduction to C++

03

Input/Output; Vars; Math, Loops, Branches

The absolute basics of C++

02

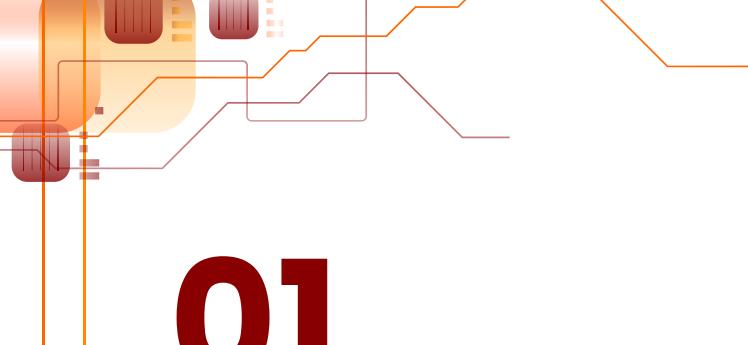

Quickly setting up an environment

Getting started with writing code

04

Assorted Challenges

Hands on examples! :0

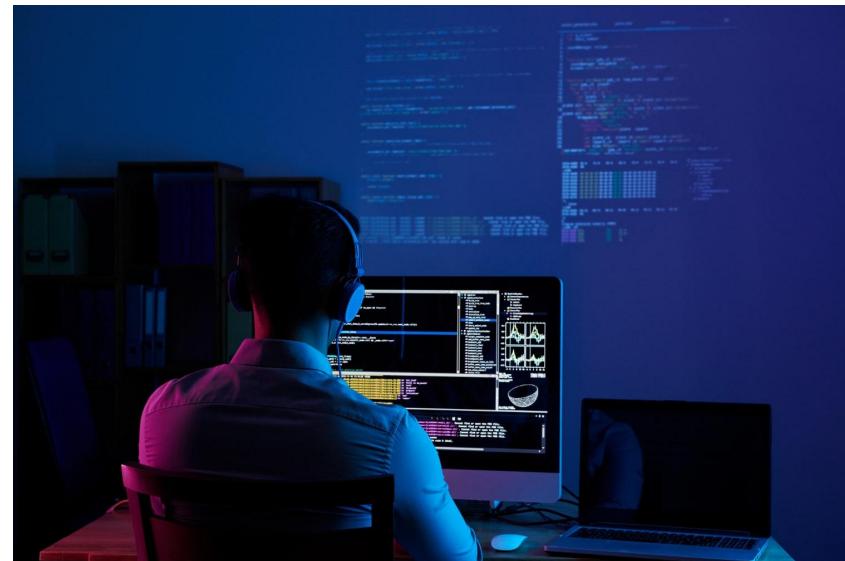

01

Why do we create code?

Coming back to this soon...

What are some things that code can accomplish?

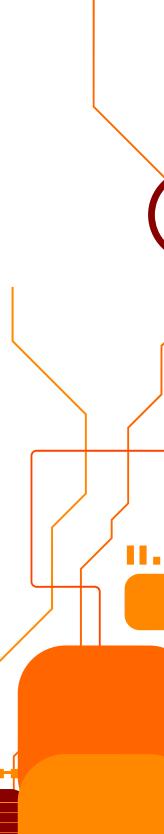

- i.e... moving robots?
- create websites?
- make phone games
- any other examples?

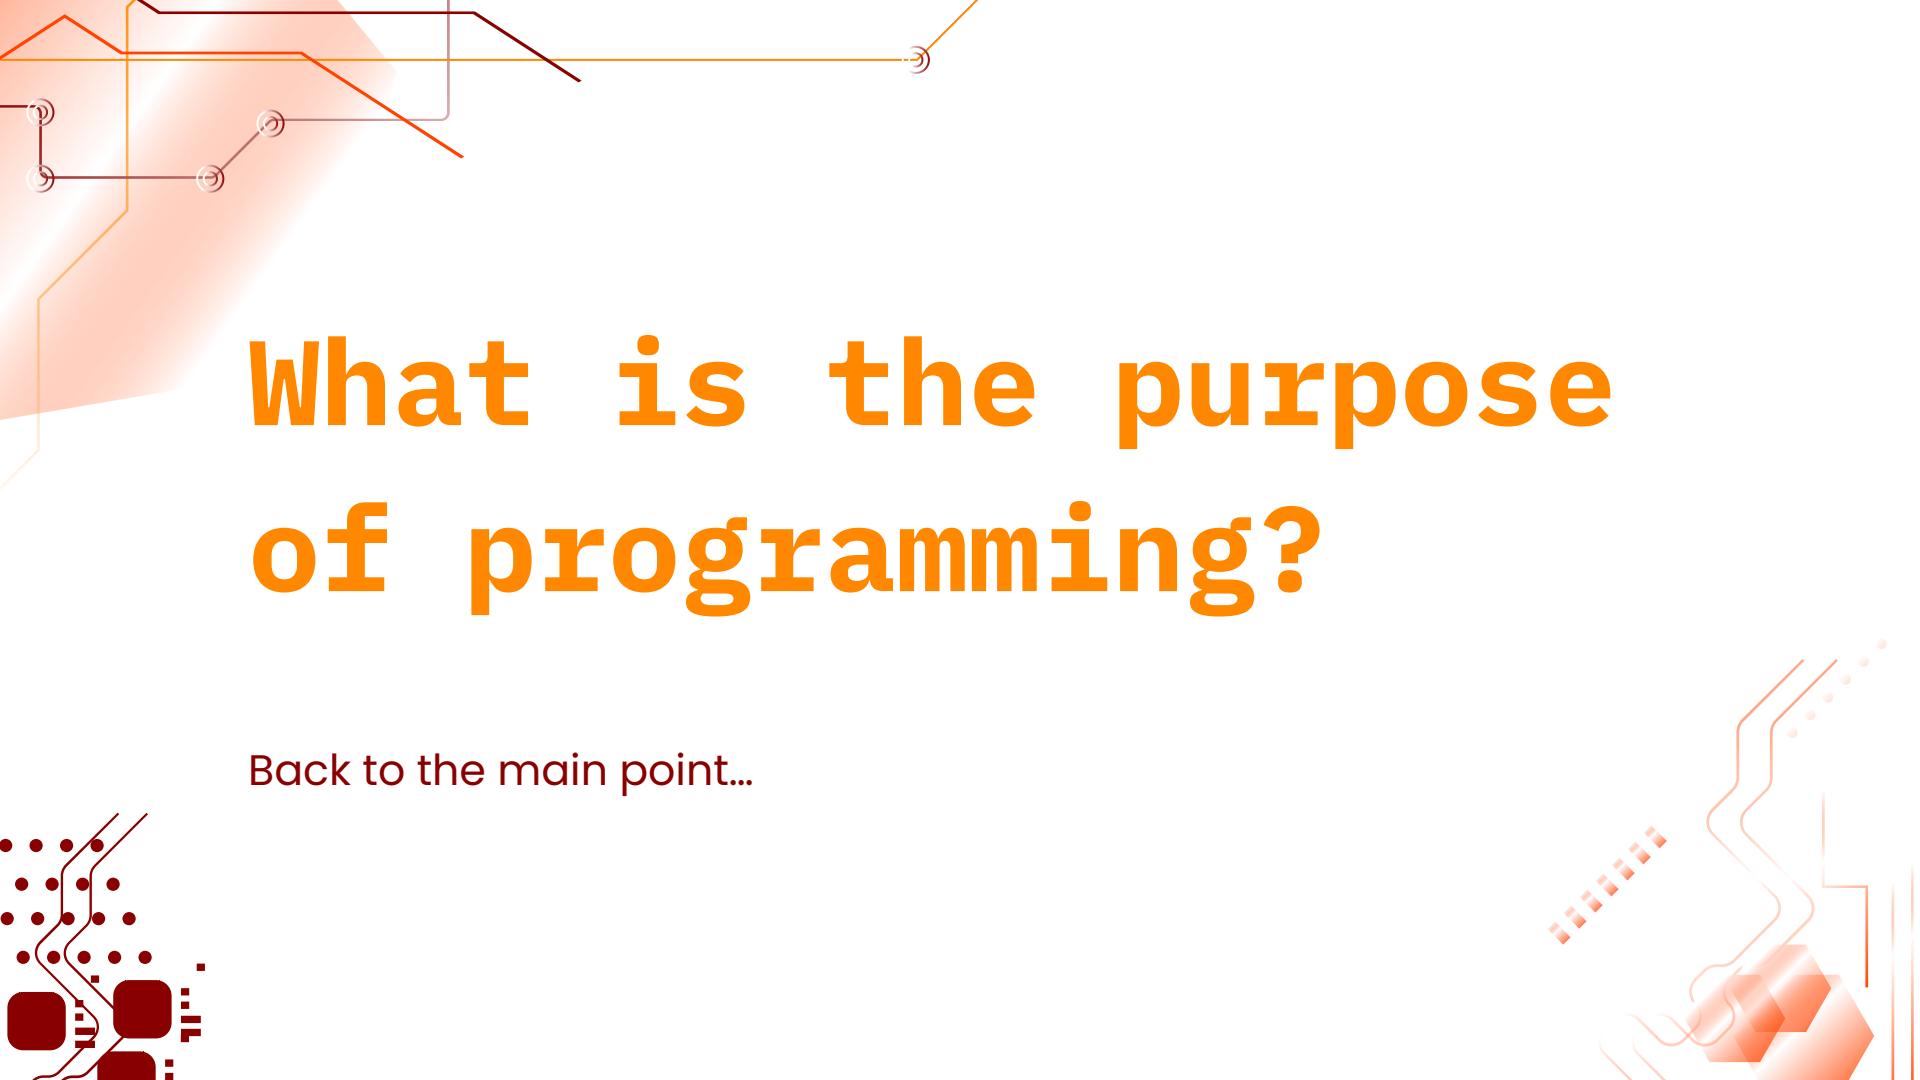

So what is a program?

Problem
Algorithm
Program/Language
System Software
SW/HW Interface
Micro-architecture
Logic
Devices
Electrons

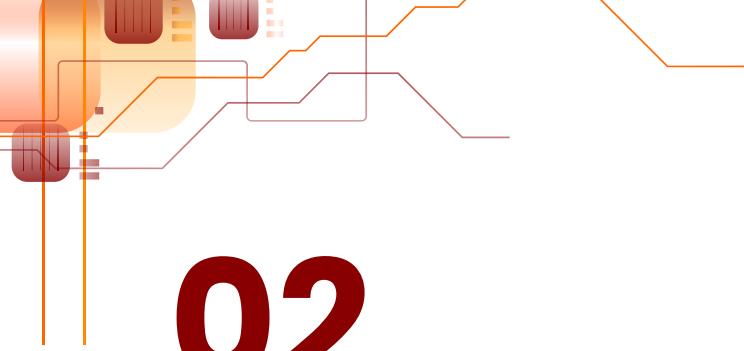

(Ignore the colours)

What is the purpose of programming?

Back to the main point...

02

Setting Up Your Environment

Very complicated.

Online IDE: Replit

Create a Replit account

Choose a Template

Template

 C++

C++ 

C++ is a low-level and cross-platform imperative language with object-oriented, generic, and functional features.

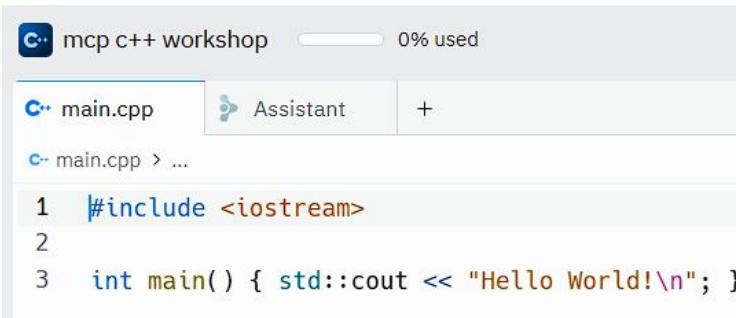

replit

Select the C++
Template

IDEs

- Code Editor, similar to a text editor
- Compiler or Interpreter
- Debugger
- Build Tools
- File/Project Management

```
DLinkedList::DLinkedList() { // constructor
    header = new DNode;           // create
    trailer = new DNode;
    header->next = trailer;     // have them
    trailer->prev = header;
    header->prev = nullptr;
    trailer->next = nullptr;
}
```

```
#include <iostream>
int main() { std::cout << "Hello World!\n"; }
```

Replit offers a cloud based solution
Convenient for small scale projects

OnlineGDB is also an option

We Recommend VScode for larger projects

C++ Under the Hood

1. Source File

When you write C++ code, you're giving the computer instructions in a language it doesn't fully understand yet. It needs to translate those instructions into something it can actually run — and that's where compiling comes in.

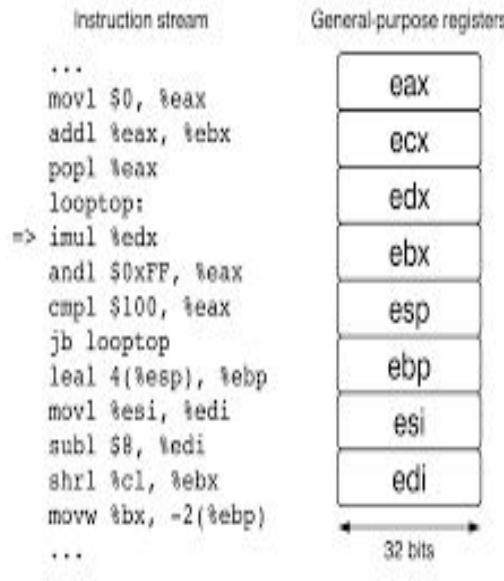

2. Compiler

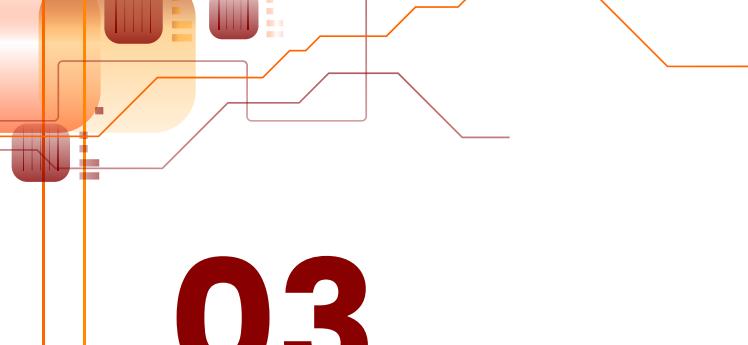

The compiler takes your .cpp file and translates it into machine code (binary) — 0s and 1s).

3. Executable File

To finally execute your program, you must run the executable file which your computer can use.

Simplified model of x86 CPU

03

Simple C++

Introducing the basic instructions

Necessities of a C++ Program

Every program has two necessary parts.

- IO -> Input + Output
- int main()

(Basically every program)

```
1 #include <iostream>
2
3 int main()
4 {
5
6 }
```

int main()

Think of it as a starting line: it tells the computer where to start following your instructions.

```
3 int main()
4 {
5     //
6     //
7     //
8 }
```

Input and Output

Think about it: why does every program need to have some form of output?

Meanwhile, is input necessary for all programs?

```
1 #include <iostream>
2 #include <stdio.h>
3 #include <ncurses.h>
4
```

The First Instruction

Most common 'first program' that people learn; still, there's a lot going on.

Where do the words, "Hello World", actually show up?

```
1  #include <iostream>
2
3  using namespace std;
4
5  int main()
6  {
7      cout << "Hello World" << endl;
8  }
```

```
cout << "Hello, World!" << endl;
```

Special Output Newline

When you want to separate outputs by a new line, there are two separate methods. Keep this in mind!

```
5  int main()
6  {
7      cout << "hi";
8      cout << endl;
9      cout << "bye";
10     cout << "\n";
11 }
```

The Console

A magic mirror.

Write on it, and you shall receive your response...

Fun Fact:

Early "Personal Computers" were much simpler than what we have today. Computer Monitors were limited to a simple ANSI Text display, along with a keyboard for input.

This changed in the 1980's, where GUI's (Graphical User Interfaces) were released, developed into the modernized displays of today.

The Complementary to 'cout'

Now what happens... Nothing!

We have to tell the program
what to do with our input first.

What does 'cin' stand for? Does
anybody know?

```
1 #include <iostream>
2
3 using namespace std;
4
5 int main()
6 {
7     int x;
8     cin >> x;
9 }
10 }
```

Integers

But wait, what does "int x" mean?

It's the most fundamental method of storing a piece of information... in this case, an integer value.

```
5 int main()
6 {
7     int x;
8     int y;
9     int count;
10    int size;
11    int apples;
12    int oranges;
13 }
```

Recording an Integer

Nothing fancy.

```
1 #include <iostream>
2
3 using namespace std;
4
5 int main()
6 {
7     int x;
8     cin >> x;
9     cout << x << "\n";
10 }
```

What About... Characters?

Letters of the alphabet.

```
1 #include <iostream>
2
3 using namespace std;
4
5 int main()
6 {
7     char x;
8 }
```

Four Fundamental Types

int -> stores an integer value

bool -> stores a boolean value

char -> stores a character value

float/double -> stores a real value

We won't be focusing on reals today! Don't worry about them for now.

```
1 #include <iostream>
2
3 using namespace std;
4
5 int main()
6 {
7     int a;
8     bool b;
9     char c;
10    double d;
11 }
```

What to do with an integer

Middle school algebra. And the assignment operator.

The equals sign sets the value of 'c' to "a + b".

```
1 #include <iostream>
2
3 using namespace std;
4
5 int main()
6 {
7     int a, b;
8     cin >> a;
9     cin >> b;
10    int c = a + b;
11 }
```

Other Basic Operations

Probably you've seen these symbols before.

```
5 int main()
6 {
7     int a, b;
8     cin >> a;
9     cin >> b;
10    int c = a + b;
11    c = a - b;
12    c = a * b;
13    c = a / b;
14 }
```

Actual Math

You can use numbers too!
Calculations aren't limited to
your previous variables.

```
5 int main()
6 {
7     int a, b;
8     cin >> a;
9     cin >> b;
10    int c = 1 + 1;
11    c = 2 - 1;
12    c = 1 - 2;
13 }
```

The Most Important Concept Today

Making decisions.

```
5 int main()
6 {
7     if (true) {
8
9     } else {
10
11 }
12 }
```

What's a Boolean?

Named after George Boole who introduced the field of boolean algebra.

A bool can only have two values: true or false. There is no other state.

```
5 int main()
6 {
7     bool yes = true;
8     bool no = false;
9 }
```

Branches

A program is essentially a plan.
We want to plan ahead for any
possible changes in this plan to
make our program fail-proof.

```
5 int main()
6 {
7     bool yes = true;
8     bool no = false;
9     if (yes) {
10
11 } else {
12
13 }
14 }
```

What Decisions Can We Make

Something I think about many times throughout the day.

```
5 int main()
6 {
7     bool am_I_hungry = true;
8     if (am_I_hungry) {
9         // go eat
10    } else {
11        // don't eat
12    }
13 }
```

Not Everything is Yes or No

A burger? A pie? Some french fries?

True or false doesn't always cut it; we need to think of different ways to ask our question.

```
5 int main()
6 {
7     bool am_I_hungry = true;
8     if (am_I_hungry) {
9         bool what_should_I_eat = false;
10        if (what_should_I_eat) {
11            // ...
12        }
13    } else {
14        // don't eat
15    }
16 }
```

Making Multiple Decisions

'if' blocks can be chained together.

```
5 int main()
6 {
7     bool am_I_hungry = true;
8     if (am_I_hungry) {
9         bool I_want_burgers = false;
10        if (I_want_burgers) {
11            // get some burgers
12        }
13        bool I_want_a_pie = false;
14        if (I_want_a_pie) {
15            // get a pie
16        }
17        bool I_want_a_french_fry = true;
18        if (I_want_a_french_fry) {
19            // get a french fry
20        }
21    }
22 }
```

Preparing For the Worst

What if our initial condition isn't true? What happens then?

Our trusty 'else' block!

```
5 int main()
6 {
7     bool yes = false;
8     if (yes) {
9
10    } else {
11
12 }
13 }
```

What Decisions Can We Make 2

Know that if you have a conditional, you'll have to account for both true and false options.

```
5  int main()
6  {
7      bool friend_is_available = false;
8      if (friend_is_available) {
9          // play some basketball
10         // play some video games
11         // idk
12     } else {
13         // find something else to do
14     }
15 }
```

Mathematic Conditionals

Sometimes you can't read the user's mind! You'll then have to figure out yourself what to do next.

```
5 int main()
6 {
7     if (2 + 2 > 3) {
8         // go on your phone
9     } else {
10        // do your homework
11    }
12 }
```

Simple AI

For when you're really tired and don't want to think.

Lines 11 and 12 are separated for readability :)

```
5 int main()
6 {
7     int how_much_money_I_have;
8     int how_much_money_it_costs;
9     cin >> how_much_money_I_have;
10    cin >> how_much_money_it_costs;
11    bool can_I_buy_it = (how_much_money_I_have >=
12        how_much_money_it_costs);
13 }
```

Other Forms of Conditionals

Less than, more than, less than or equal to, more than or equal to.
There are many possible conditionals you can put in an if statement.

```
5 int main()
6 {
7     int a;
8     int b;
9     cin >> a >> b;
10    bool x = (a > b);
11    x = (a < b);
12    x = (a + b) > 5;
13 }
```

Loops!

There are two types of loops;
we'll cover 'while' loops today.

The other type takes longer to
type.

```
5 int main()
6 {
7     bool yes = true;
8     while (yes) {
9         // do something
10    }
11 }
```

Cheering Up One's Self

Let's analyse this program
together!

A variable on the left hand side
can refer to itself on the right
hand side.

```
5 int main()
6 {
7     int count;
8     cin >> count;
9     while (count > 0) {
10         cout << "you are special.";
11         cout << "\n";
12         count = count - 1;
13     }
14 }
```

Will this Loop Ever End?

Be careful writing your loop conditions!

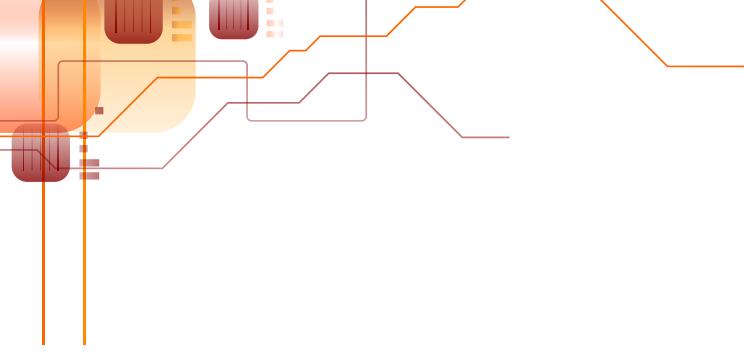

```
5  int main()
6  {
7      int i;
8      cin >> i;
9      while (i > 0) {
10         cout << "our variable is now: ";
11         cout << i << endl;
12         i = i + 1;
13     }
14 }
```

What Have We Learned?

In essence, I've gone through the three fundamental parts of a computer program.

1. Store and retrieve information
2. Gather and create new information
3. Make decisions

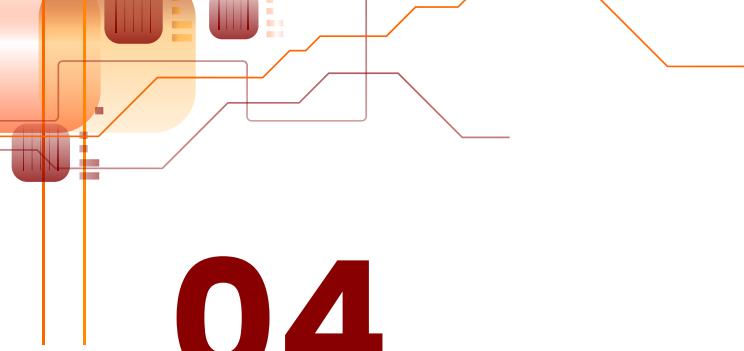

```
5 int main()
6 {
7     int steps;
8     int goal;
9     cin >> steps;
10    cin >> goal;
11    if (steps > goal) {
12        cout << "Great Job!";
13    } else {
14        cout << "Keep Going!";
15    }
16 }
```

That's All of the Basics

All you needed to know.. for now...

Next up: our challenge problems!

04

Some Practical Exercises

Make sure you try them out yourself!

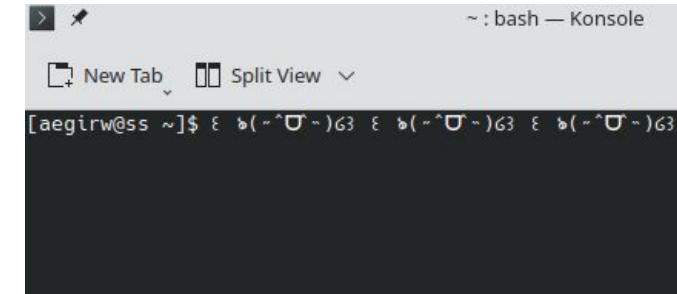

Problem Title

Problem Description.

A paragraph explaining the problem will be shown here. Read through it carefully!

Expected Input/Output

What the program's input/output should look like when your code is correct.

The image shows a screenshot of a terminal window titled "Konsole". The window has a dark background and light-colored text. At the top, there are buttons for "New Tab" and "Split View". Below the title bar, the text "aegirw@ss ~]\$ " is repeated three times, each followed by a cursor symbol. The window is set against a background of abstract blue and purple dots and lines.

Adding Two Numbers

Your task is simple: receive two integers from the user and add them.

Input: two integers, separated by a space.

Output: the sum of the two integers

Input:

A text input field containing the numbers "1" and "1" separated by a space, with a cursor positioned after the second "1".

Output:

A text input field containing the number "2", with a cursor positioned after it.

Solution 1

Adding N Numbers

The user will give you a number. Then, they will give you a list of that size of integers. Your task is to add them all and return the sum.

Input: The first line will contain N , where N is the size of the list of numbers. The second line will contain that list of numbers.

Output: The sum of these numbers

Input

```
3  
1 2 3|
```

Output

```
6|
```

Solution 2

Min-Max Sum

Given three numbers, find the minimum and maximum sum after choosing two of three numbers.

For example, given the three numbers [2, 4, 6], the maximum sum would be 10, and the minimum sum would be 6.

Input: three positive integers

Output: the minimum sum, then the maximum sum.

Input:

1 10 3|

Output:

4 13|

Solution 3

Maximizing Ice Cream

It's a hot summer day out, and you currently have 'A' ice cream cones. A suspicious man comes up to you and offers you two choices; the first is to receive 'B' extra ice cream cones, and the second is to multiply your current number of ice cream cones by 'C'. Which choice maximizes your ice cream cones?

Input: three integers, A, B, and C

Output: B or C depending on the better choice

Input:

5 10 2|

Output:

B|

Solution 4

Maximizing Ice Cream 2

Now, you'll have to solve the problem more than once. The input will start with a number 'N', and you'll receive the three previous integers 'N' number of times.

Input: the number N. Then, on 'N' lines, you'll receive three integers, A, B, and C.

Output: B or C depending on the better choice, for each of the 'N' inputs.

Input:

```
3
5 10 2
5 1 2
3 4 2
```

Output:

```
B
C
B|
```

Solution 5

Maximizing Ice Cream 3

What if both choices give the same number of ice creams? We want to deal with the special case!

Input: the number N. Then, on 'N' lines, you'll receive three integers, A, B, and C.

Output: B or C depending on the better choice for each of the 'N' inputs. In the case that both choices give equal benefits, output the word "EQUAL".

Input:

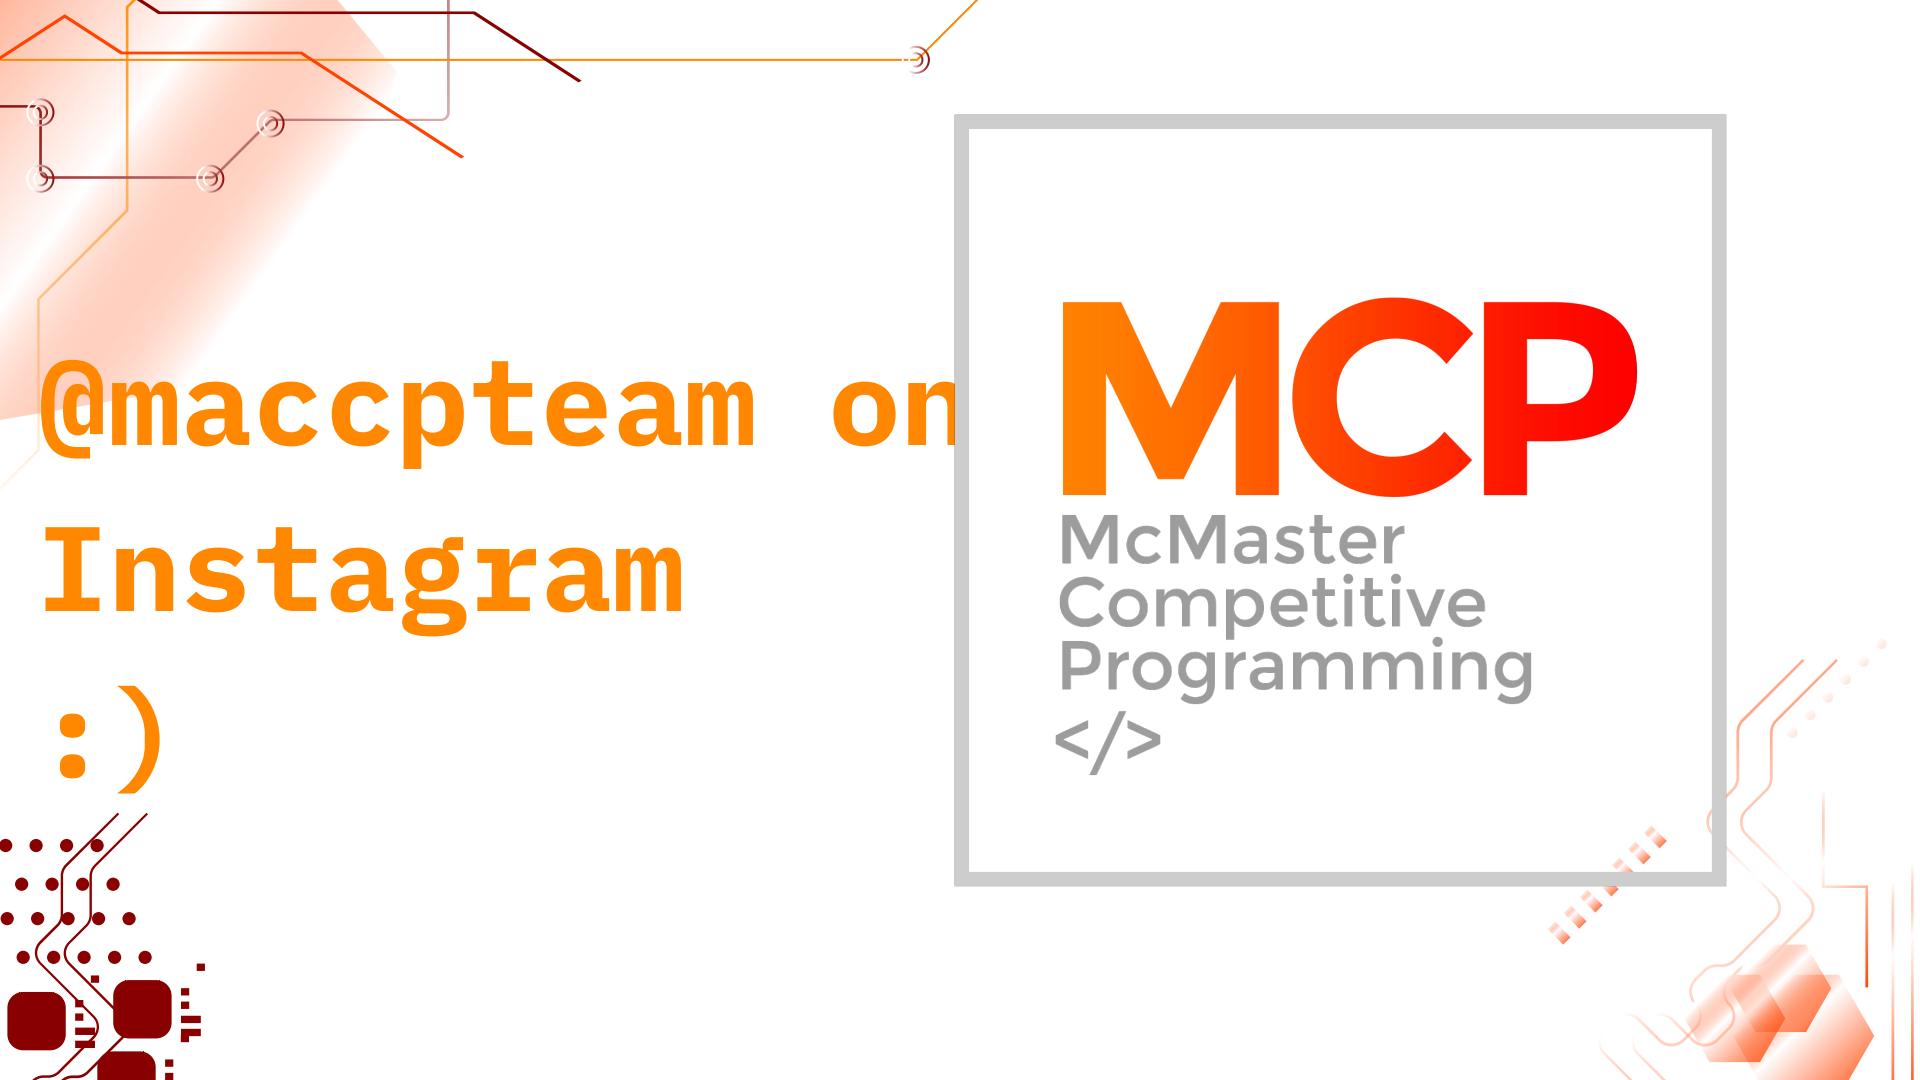

```
1  
2 2 2|
```

Output:

```
EQUAL|
```

Solution 6
